

rebLOUVRE

Aluminium Adjustable Louvre Systems

Introducing a new adjustable louvre, bottom rolling, stacking, folding door system. This system is manufactured from high grade aluminium alloy, provided in an exterior grade epoxy powder coated finish to client's colour requirements.

The system is constructed of rigid purpose made aluminium extruded sections. All hinges and rolling gear are fabricated ex-aluminium powder coated with either a black or white finish. The bottom roller is fabricated from stainless steel. The system is located by means of a roller guide into the frame head and positively run on an extruded aluminium tee section track.

Concealed flush bolt mechanism secures the sashes into the head and cill to ensure that the system is "rattle free" when in the closed position. A double cylinder hook lock ensures that the system cannot be opened even if the flush bolt mechanisms are not secured.

Look no further - this is the system your home has been waiting for!

"Quality is derived from what you inspect,
not what you expect"
